

Study area

We plan to establish several study areas across Taiwan, with transects either along elevation gradient (changes in cloud frequency, but also in temperature, precipitation and other environmental factors), or along the cloud frequency gradient (keeping the elevation constant, but moving from areas with less frequent to more frequent cloud) or along the wind intensity gradient (again, keeping the elevation constant while sampling windward vs leeward locations).

Lalashan elevation transect

Located in Northern part of Taiwan, New Taipei City district, and ranges from the top of Mt. Taman (塔曼山) toward north-east direction down to Mt. Badauer (拔刀爾山).

Map of plots:

Turist map of Lalashan transect (not included locality close to Mt. Badauer):
